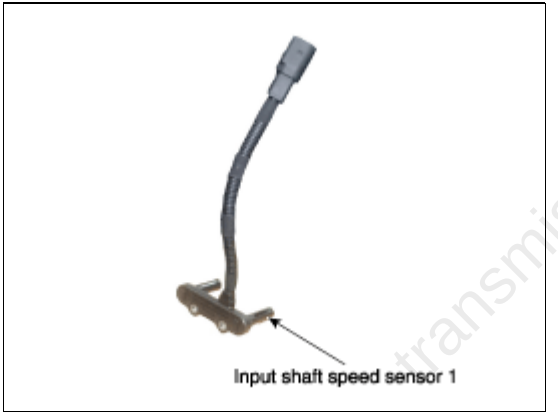
Hyundai Kona: Dual Clutch Transmission Control System / Input shaft speed sensor 1 Description and operation

transmissionmanuals.com

Description

- Components location : DCT (Dual Clutch Transmission)



- Function
  The input shaft speed sensor is important in that it detects the input shaft RPM and sends this information to the Transmission Control Module (TCM).
  It provides important input information for electric control.
  The information is needed in all operations, including feedback control, gear shift control and faliure detection of other sensors.
